SUBCOMPONENT NAILER

The brand-new automated Panels Plus Sub-Component Nailer precisely, quickly and effectively nails sub-component assemblies together for subcomponents – from beam pockets, beam ledgers, jack to king studs, U, L, 2-stud L, C-shaped and more – that are up to 7-ply and ranging in size from 2” x 4” to 2” x 10”. The nailer’s user-friendly, intuitive design allows quick and effortless reloading across six nail tools, each equipped with “mega coils” that hold up to 2,500 nails each.
The machine is equipped with a camera sensor that determines what subcomponent is being nailed. An optional outfeed pusher ejects the completed subcomponent from the outfeed conveyor, making room for the next component to be assembled.
